

SAMUEL NTOW KYERE

n8n Developer | AI Automation Engineer

mr.kyere.s@gmail.com | [Github](#) | [Linkedin](#) | [Medium](#)

PROFESSIONAL SUMMARY

n8n Developer and AI Automation Engineer with 3 years of experience designing high-leverage automation layers for enterprise teams. Expert in n8n orchestration, Multi-Agent AI systems, and RAG pipelines. Skilled at bridging low-code and no-code workflows through custom Python and Node.js scripts. Proven ability to identify operational inefficiencies and deploy elegant, low-latency solutions, reducing overhead by up to **85%**, providing both the technical depth and business instinct to identify which automations deliver real leverage.

CORE COMPETENCIES

Automation: n8n, API integrations, webhooks, ETL pipelines, workflow orchestration

AI & LLM: OpenAI API, LangChain, RAG pipelines, AI agents, prompt engineering, Claude, Grok

Scripting: Python, JavaScript (Node.js)

Data: JSON, YAML, CSV, pandas, schema validation, data pipelines

Infrastructure: Docker, PostgreSQL, Git, GitHub

Soft Skills: Process auditing, technical documentation, async remote collaboration, cross-team communication

PROFESSIONAL EXPERIENCE

AI Automation Engineer | **Visual Alpha** Jan 2024 – Dec 2025 | Remote

AI-powered financial data intelligence platform serving institutional investors across Japan, including Nomura, Resona Bank, and Sumitomo Mitsui DS Asset Management.

- Owned end-to-end onboarding of client investment mandates and financial data into the platform, ensuring every new client data structure was correctly mapped, validated, and loaded via automation scripts rather than manual database entry.
- Served as the operational bridge between the client support team and engineering, triaging data issues, translating reported problems into technical fixes, and resolving blockers, maintaining 100% of new clients
- Reduced manual data processing and client onboarding time by 40 to 85% through scripted automation of previously manual database workflows.

Technical Mentor | **Microverse** Dec 2022 – Oct 2023 | Remote

- Supported incoming students through month one, statistically the highest dropout period, through structured code reviews, debugging sessions, and workflow coaching.
 - Maintained a 0% mentee dropout rate across the full mentorship tenure.
 - Translated complex technical concepts and curriculum requirements into clear, actionable guidance that improved student confidence and delivery consistency.
-

PROJECTS

WhatsApp Lead Qualification & Sales Automation

Stack: *n8n, Evolution API, OpenAI API, PostgreSQL, Redis, Docker, Google Sheets API*

- Automation to solve Facebook Ads driving high volumes of inbound WhatsApp messages for a local men's apparel business, requiring constant manual responses to low-intent, repetitive inquiries.
- Designed an 80/20 human-in-the-loop architecture where an AI agent handles qualification autonomously and escalates only when a lead is ready to close, keeping the human in the loop exclusively for high-value interactions.
- Self-hosted the entire stack via Docker, cutting automation infrastructure cost from \$150/month to zero by replacing paid WhatsApp Business API services with Evolution API.
- Syncs qualified lead data and order status to Google Sheets in real time, with automated owner alerts on conversion.

FAQ Chatbot & RAG Knowledge Agent

Stack: *Python, LangChain, ChromaDB, n8n, Grok*

[Video here](#)

- Built independently after identifying a recurring support problem: no automated FAQ layer existed for common client questions, creating avoidable manual workload for the team.
- Designed and built a Retrieval-Augmented Generation pipeline: embedded FAQ and business documentation into a local ChromaDB instance, bridged via custom Python script calls into n8n (no native ChromaDB node existed at the time), with Grok handling inference.

Internal Data Seeding Automation

Stack: *n8n, Slack API, Confluence API, Python, Node.js, Google Drive API*

[Video here](#)

- A single Slack slash command with parameters now triggers the correct n8n webhook, runs the seeding pipeline, updates the shared Confluence tracking page on success, and sends a Slack confirmation, or logs the failed step and error path to a local directory and notifies via Slack bot on failure.
- Used in production as the sole operational interface for all client data seeding throughout the contract, improving efficiency and productivity by 60%.
